

Abstract

1 A wireless terminal is disclosed that interfaces a radio on a radio card to a wireless
2 terminal with a single two-lead cable that is capable of carrying both: (1) RF signals from the
3 radio card to an antenna on a wireless terminal, and (2) radio status signaling from the radio card
4 to a display on the wireless terminal. The wireless terminal comprises (1) an antenna, (2) a first
5 visual indicator that indicates to a user of the wireless terminal when a radio is transmitting, and
6 (3) a signal lead for carrying an RF signal from the radio to the antenna and for carrying a first
7 baseband signal from the radio to the first visual indicator.
